Data Mining With Python and R

Welcome to my Data Mining With Python and R tutorials! In these tutorials, you will learn a wide array of concepts about Python and R programing in Data Mining. The PDF version can be downloaded from HERE.

ONE

PREFACE

1.1 About this tutorial

This document is a summary of my Data Mining Methds & Application (STAT 577) course in University of Tennessee at Knoxville. You may download and distribute it. Please be aware, however, that the note contains typos as well as inaccurate or incorrect description. At here, I would like to thank Dr. Haileab Hilafu for providing some of his R code and homework solutions. I also would like to thank Bo Gao, Le Yin, Chen Wen, Jian Sun and Huan Chen for the valuable disscussion and thank the generous anonymous authors for providing the detailed solutions and source code on the Internet. Without those help, those tutorials would not have been possible to be made. In those tutorials, I try to use the detailed demo code to show how to use each functions in R and Python to do data mining. If you find your work wasn't cited in this note, please feel free to let me know.

Although I am by no means an data mining programming expert, I decided that it would be useful for me to share what I learned about data mining programming in the form of easy tutorials with detailed example. I hope those tutorials will be a valuable tool for your studies.

The tutorials assume that the reader has a preliminary knowledge of programing and unix. And this document is generated automatically by using sphinx.

1.2 Motivation for this tutorial

Data mining is a relatively new, while the technology is not. Here are the sevaral main motivation for this tutorial:

- 1. It is no exaggeration to say that data mining has thunderstorms impacted on our real lives. I have great interest in data mining and am eager to learn those technologies.
- 2. Fortunely, I had a chance to register Dr. Haileab Hilafu's Data Mining Methds & Application class. Dr.Haileab Hilafu and his class inspired me to do a better job.
- 3. However, I still found that learning data mining programing was a difficult process. I have to Google it and identify which one is true. It was hard to find detailed examples which I can easily learned the full process in one file.
- 4. Good sources are expensive for a graduate student.

1.3 Feedback and suggestions

Your comments and suggestions are highly appreciated. I am more than happy to receive corrections, suggestions or feedbacks through email (Wenqiang Feng: wfeng1@vols.utk.edu) for improvements.

PYTHON OR R FOR DATA ANALYSIS?

Note: Sharpening the knife longer can make it easier to hack the firewood – old Chinese proverb

There is an old Chinese proverb that Says 'sharpening the knife longer can make it easier to hack the firewood'. In other words, take extra time to get it right in the preparation phase and then the work will be easier. So it is worth to take several minites to think about which programming language is better for you.

When you google it, you will get many useful results. Here are some valueable information from Quora:

2.1 Ponder over questions

- Six questions to ponder over from Vipin Tyagi at Quora
 - 1. Is your problem is purely data analysis based or mixed one involving mathematics, machine-learning, artificial intelligence based?
 - 2. What are the commonly used tools in your field?
 - 3. What is the programming expertise of your human resources?
 - 4. What level of visualization you require in your presentations?
 - 5. Are you academic, research-oriented or commercial professional?
 - 6. Do you have access to number of data analytic softwares for doing your assignment?

2.2 Comparison List

• comparative list from Yassine Alouini at Quora

	R	Python
advantages	 great for prototyping great for statistical analysis nice IDE 	 great for scripting and automating your different data mining pipelines integrates easily in a production workflow can be used across different parts of your software engineering team scikit-learn library is awesome for machine-learning tasks. Ipython is also a powerful tool for exploratory analysis and presentations
disadvantages	 syntax could be obscure libraries documentation isn't always user friendly harder to integrate to a production workflow. 	 It isn't as thorough for statistical analysis as R learning curve is steeper than R, since you can do much more with Python

2.3 My Opinions

In my opinion, **R** and **Python** are both choices. Since they are open-source softwares (open-source is always good in my eyes) and are free to download. If you are a beginer without any programming experience and only want to do some data analysis, I would definitely suggest to use **R**. Otherwise, I would suggest to use both.

CHAPTER

THREE

GETTING STARTED

Note: Good tools are prerequisite to the successful execution of a job – old Chinese proverb

Let's keep sharpening our tools. A good programming platform can save you lots of troubles and time. Herein I will only present how to install my favorite programming platform for R and Python and only show the easiest way which I know to install them on Linux system. If you want to install on the other operator system, you can Google it. In this section, you may learn how to install R, Python and the corresponding programming platform and package.

3.1 Installing programming language

Python

Go to Ubuntu Software Center and follow the following steps:

- 1. Open Ubuntu Software Center
- 2. Search for python
- 3. And click Install

Or Open your terminal and using the following command:

R

Go to Ubuntu Software Center and follow the following steps:

- 1. Open Ubuntu Software Center
- 2. Search for r-base
- 3. And click Install

Or Open your terminal and using the following command:

```
sudo apt-get update
sudo apt-get install r-base
```

3.2 Installing programming platform

My favorite programming platform for R is definitely RStudio IDE and for Python is PyCharm.

Python

• Installing PyCharm

Go to Ubuntu Software Center and follow the following steps:

- 1. Open Ubuntu Software Center
- 2. Search for Eclipse
- 3. And click Install

Here is the video tutorial for installing Pydev for Eclipse on Youtube: Pydev on Youtube

R

• Installing RStudio

Go to Ubuntu Software Center and follow the following steps:

- 1. Open Ubuntu Software Center
- 2. Search for RStudio
- 3. And click Install

3.3 Installing packages

Python

· Installing package for Python

Install package or modules for Python in Linux can also be quite easy. Here I will only present installation by using pip.

Installing pip

```
sudo easy_install pip
```

Installing numpy

```
pip install numpy
```

· Installing pandas

```
pip install pandas
```

• Installing scikits-learn

```
pip install -U scikit-learn
```

The following are the best Python modules for data mining from kdnuggets, you may also want to install all of them.

- 1. Basics
- numpy numerical library, http://numpy.scipy.org/
- scipy Advanced math, signal processing, optimization, statistics, http://www.scipy.org/
- matplotlib, python plotting Matplotlib, http://matplotlib.org
- 2. Machine Learning and Data Mining
- MDP, a collection of supervised and unsupervised learning algorithms, http://pypi.python.org/pypi/ MDP/2.4
- mlpy, Machine Learning Python, http://mlpy.sourceforge.net
- NetworkX, for graph analysis, http://networkx.lanl.gov/
- Orange, Data Mining Fruitful & Fun, http://biolab.si
- pandas, Python Data Analysis Library, http://pandas.pydata.org
- pybrain, http://pybrain.org
- scikits-learn Classic machine learning algorithms Provide simple an efficient solutions to learning problems, http://scikit-learn.org/stable/
- 3. Natural Language
- NLTK, Natural Language Toolkit, http://nltk.org
- 4. For web scraping
- Scrapy, An open source web scraping framework for Python, http://scrapy.org
- urllib/urllib2

Herein I would like to add one more important package **Theano** for deep learning and **textmining** for text mining:

- Theano, deep learning, http://deeplearning.net/tutorial/
- **textmining**, text mining, https://pypi.python.org/pypi/textmining/1.0

R

• Installing package for R

Install package for R in RStudio os super easy, I will use tree package as a example:

install.packages("tree")

The following are the top 20 R machine learning and data science packages from Bhavya Geethika, you may want to install all of them.

- e1071 Functions for latent class analysis, short time Fourier transform, fuzzy clustering, support vector machines, shortest path computation, bagged clustering, naive Bayes classifier etc (142479 downloads)
- **rpart** Recursive Partitioning and Regression Trees. (135390)
- **igraph** A collection of network analysis tools. (122930)
- nnet Feed-forward Neural Networks and Multinomial Log-Linear Models. (108298)
- randomForest Breiman and Cutler's random forests for classification and regression. (105375)
- **caret** package (short for Classification And REgression Training) is a set of functions that attempt to streamline the process for creating predictive models. (87151)
- kernlab Kernel-based Machine Learning Lab. (62064)
- glmnet Lasso and elastic-net regularized generalized linear models. (56948)
- **ROCR** Visualizing the performance of scoring classifiers. (51323)
- **gbm** Generalized Boosted Regression Models. (44760)
- party A Laboratory for Recursive Partitioning. (43290)
- arules Mining Association Rules and Frequent Itemsets. (39654)
- **tree** Classification and regression trees. (27882)
- klaR Classification and visualization. (27828)
- **RWeka** R/Weka interface. (26973)
- **ipred** Improved Predictors. (22358)
- lars Least Angle Regression, Lasso and Forward Stagewise. (19691)
- earth Multivariate Adaptive Regression Spline Models. (15901)
- **CORElearn** Classification, regression, feature evaluation and ordinal evaluation. (13856)
- **mboost** Model-Based Boosting. (13078)

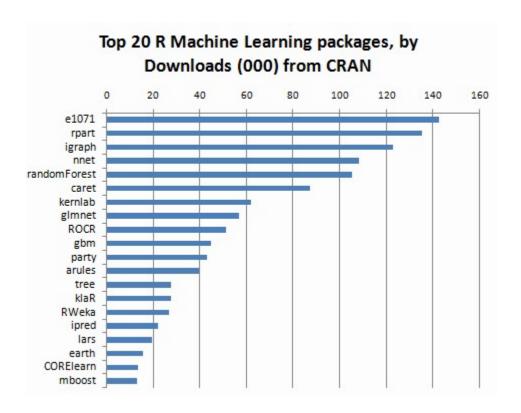

Fig. 1: Top 20 R Machine Learning and Data Science packages. From http://www.kdnuggets.com/2015/06/top-20-r-machine-learning-packages.html

DATA ANALYSIS PROCEDURES

Note: Know yourself and know your enemy, and you will never be defeated – idiom, from Sunzi's Art of War

4.1 Procedures

Data mining is a complex process that aims to discover patterns in large data sets starting from a collection of exsting data. In my opinion, data minig contains four main steps:

- 1. **Collecting data**: This is a complex step, I will assume we have already gotten the datasets.
- 2. **Pre-processing**: In this step, we need to try to understand your data, denoise, do dimentation reduction and select proper predictors etc.
- 3. **Feeding data mining**: In this step, we need to use your data to feed your model.
- 4. **Post-processing**: In this step, we need to interpret and evaluate your model.

In this section, we will try to know our enemy – datasets. We will learn how to load data, how to understand data with statistics method and how to underdtand data with visualization. Next, we will start with Loading Datasets for the Pre-processing.

4.2 Datasets in this Tutorial

The datasets for this tutorial are available to download: Heart, Energy Efficiencey. Those data are from my course matrials, the copyrights blongs to the original authors.

4.3 Loading Datasets

There are two main data formats ".csv" and ".xlsx". We will show how to load those two types of data in **R** and **Python**, respectively.

1. Loading datasets in R

• Loading *.csv format data

```
# set the path or enverionment
setwd("/home/feng/R-language/sat577/HW#4/data")
# read data set
rawdata = read.csv("spam.csv")
```

• Loading *.xlsx format data

```
# set the path or enverionment
setwd("~/Dropbox/R-language/sat577/")

#install.packages("readx1") # CRAN version
library(readx1)

# read data set
energy_eff=read_excel("energy_efficiency.xlsx")
```

2. Loading datasets in Python

• Loading *.csv format data

• Loading *.xlsx format data

4.4 Understand Data With Statistics methods

After we get the data in hand, then we can try to understand them. I will use "Heart.csv" dataset as a example to demonstrate how to use those statistics methods.

1. Summary of the data

It is always good to have a glance over the summary of the data. Since from the summary you will know some statistics features of your data, and you will also know whether you data contains missing data or not.

• Summary of the data in R

```
summary(rawdata)
```

Then you will get

> summary(rawdata)			
Age	Sex	ChestPain	
→RestBP			
	Min. :0.0000	asymptomatic:144	Min.

2. The size of the data

Sometimes we also need to know the size or dimension of our data. Such as when you need to extract the response from the dataset, you need the number of column, or when you try to split your data into train and test data set, you need know the number of row.

• Checking size in **R**

```
dim(rawdata)
```

Or you can use the following code

```
nrow=nrow(rawdata)
ncol=ncol(rawdata)
c(nrow, ncol)
```

Then you will get

```
> dim(rawdata)
[1] 303 14
```

Checking size in Python

```
nrow, ncol = rawdata.shape
print nrow, ncol
```

or you can use the follwing code

```
nrow=rawdata.shape[0] #gives number of row count
ncol=rawdata.shape[1] #gives number of col count
print nrow, ncol
```

Then you will get

```
Raw data size
303 14
```

3. Data format of the predictors

Data format is also very important, since some functions or methods can not be applied to the qualitative data, you need to remove those predictors or transform them into quantitative data.

• Checking data format in R

```
# install the package
install.packages("mlbench")
library(mlbench)
sapply(rawdata, class)
```

Then you will get

```
> sapply(rawdata, class)
Age Sex ChestPain RestBP Chol Fbs ____

RestECG (continues on next page)
```

(continued from previous page)

• Checking data format in **Pyhton**

```
print rawdata.dtypes
```

Then you will get

```
Data Format:
          int64
Age
           int64
Sex
ChestPain object
RestBP
          int64
Chol
           int64
Fbs
           int64
RestECG
           int64
           int64
MaxHR
ExAng
           int64
ExAng int64
Oldpeak float64
Slope
           int64
Ca
         float64
Thal
          object
AHD
           object
dtype: object
```

4. The column names

• Checking column names of the data in **R**

```
colnames(rawdata)
attach(rawdata) # enable you can directly use name as

predictors
```

Then you will get

```
> colnames(rawdata)
[1] "Age" "Sex" "ChestPain" "RestBP" "Chol"
[6] "Fbs" "RestECG" "MaxHR" "ExAng" "Oldpeak"
[11] "Slope" "Ca" "Thal" "AHD"
```

• Checking column names of the data in **Python**

```
colNames = rawdata.columns.tolist()
print "Column names:"
print colNames
```

Then you will get

```
Column names:
['Age', 'Sex', 'ChestPain', 'RestBP', 'Chol', 'Fbs', 'RestECG

→', 'MaxHR',
'ExAng', 'Oldpeak', 'Slope', 'Ca', 'Thal', 'AHD']
```

5. The first or last parts of the data

• Checking first parts of the data in **R**

```
head(rawdata)
```

Then you will get

```
> head(rawdata)
           ChestPain RestBP Chol Fbs RestECG MaxHR ExAng
  Age Sex
→Oldpeak
                                                      0 _

You can use the samilar way to check the last part of the data, for simplicity, i will skip it.

6. Correlation Matrix

• Computing correlation matrix in **R**

```
# get numerical data and remove NAN
numdata=na.omit(rawdata[,c(1:2,4:12)])
# computing correlation matrix
cor(numdata)
```

Then you will get

```
> cor(numdata)

4.5 Understand Data With Visualization

A picture is worth a thousand words. You will see the powerful impact of the figures in this section.

- 1. Summary plot of data in figure
 - Summary plot in R

```
# plot of the summary
plot(rawdata)
```

Then you will get Figure Summary plot of the data with R.

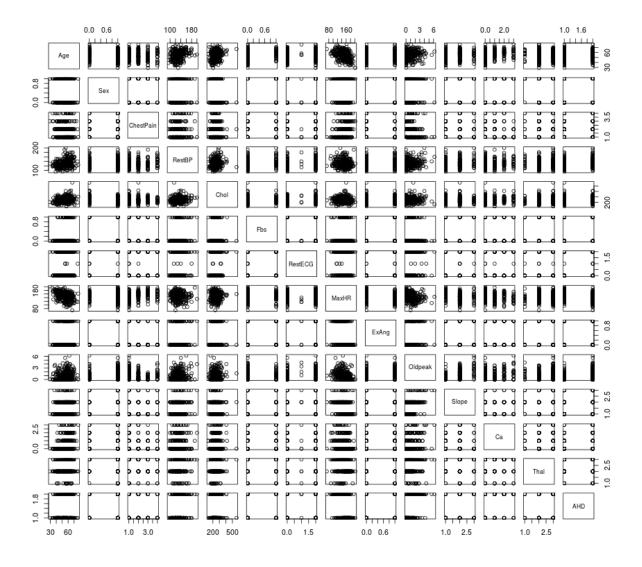

Fig. 1: Summary plot of the data with R.

• Summary plot in Python

```
# plot of the summary
plot(rawdata)
```

Then you will get Figure Summary plot of the data with Python.

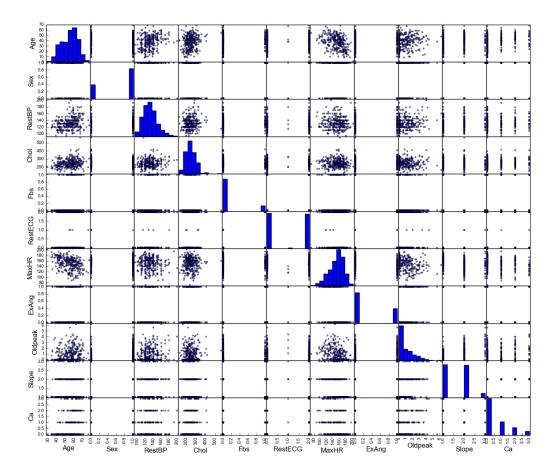

Fig. 2: Summary plot of the data with Python.

2. Histogram of the quantitative predictors

• Histogram in R

```
# Histogram with normal curve plot
dev.off()
Nvars=ncol(numdata)
name=colnames(numdata)
par(mfrow =c (4,3))
for (i in 1:Nvars)
{
    x<- numdata[,i]</pre>
```

(continues on next page)

Then you will get Figure *Histogram with normal curve plot in R*.

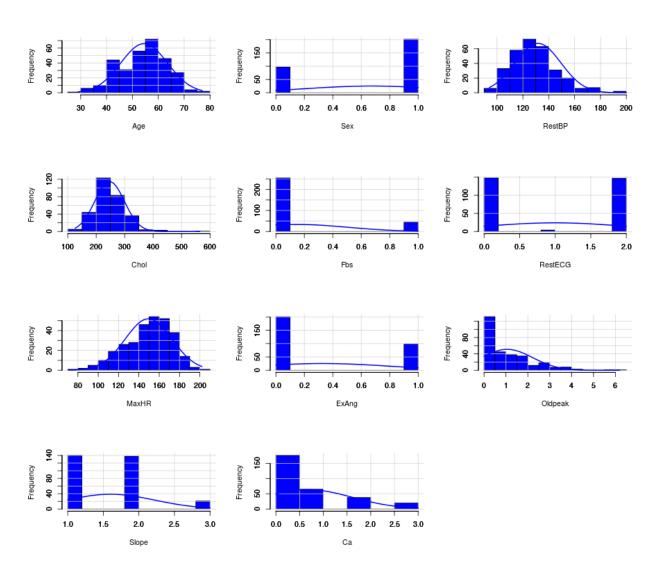

Fig. 3: Histogram with normal curve plot in R.

• Histogram in in **Python**

```
# Histogram
rawdata.hist()
plt.show()
```

Then you will get Figure Histogram in Python.

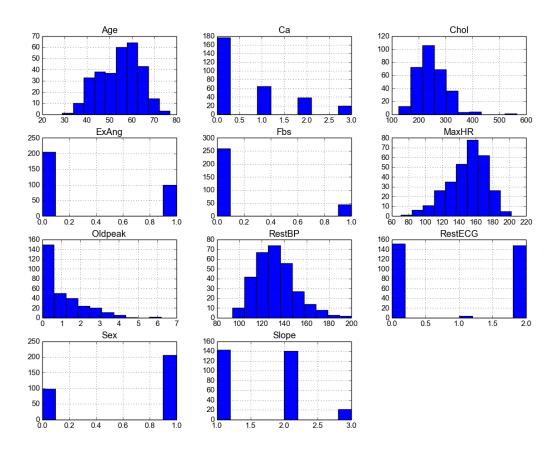

Fig. 4: Histogram in Python.

3. Boxplot of the quantitative predictors

• Boxplot in **R**

```
continued from previous page)
boxplot(numdata[,i],data=numdata,main=name[i])
}
```

Then you will get Figure Boxplots in R.

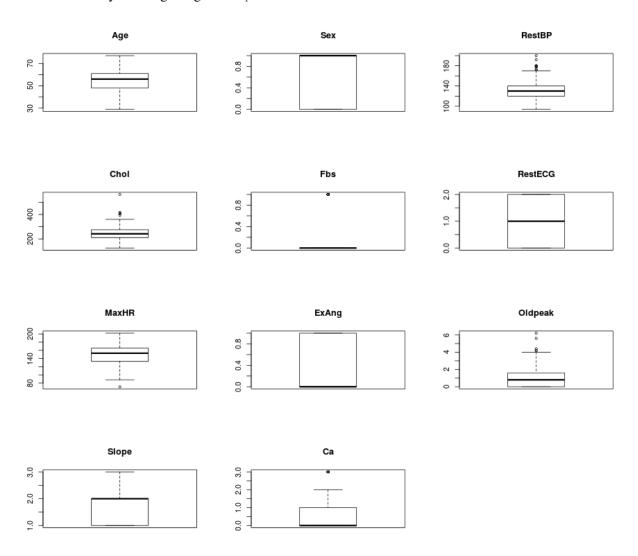

Fig. 5: Boxplots in R.

• Boxplot in **Python**

```
# boxplot
pd.DataFrame.boxplot(rawdata)
plt.show()
```

Then you will get Figure Histogram in Python.

4. Correlation Matrix plot of the quantitative predictors

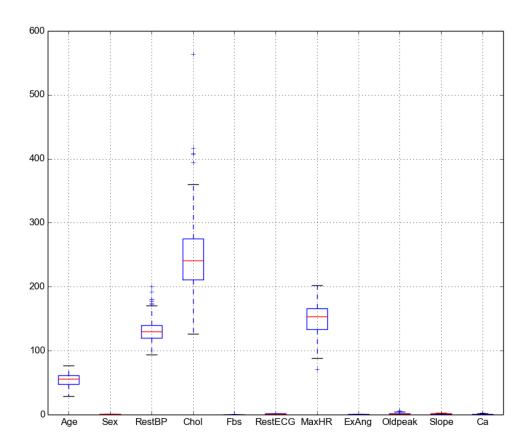

Fig. 6: Histogram in Python.

• Correlation Matrix plot in R

```
dev.off()
# laod cocorrelation Matrix plot lib
library(corrplot)
M <- cor(numdata)
#par(mfrow =c (1,2))
#corrplot(M, method = "square")
corrplot.mixed(M)</pre>
```

Then you will get Figure Correlation Matrix plot in R.

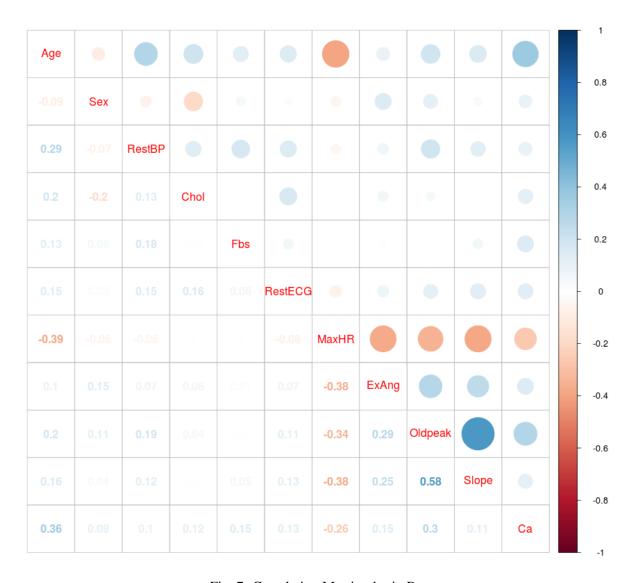

Fig. 7: Correlation Matrix plot in R.

• Correlation Matrix plot in Python

```
# cocorrelation Matrix plot
pd.DataFrame.corr(rawdata)
plt.show()
```

Then you will get get Figure Correlation Matrix plot in Python.

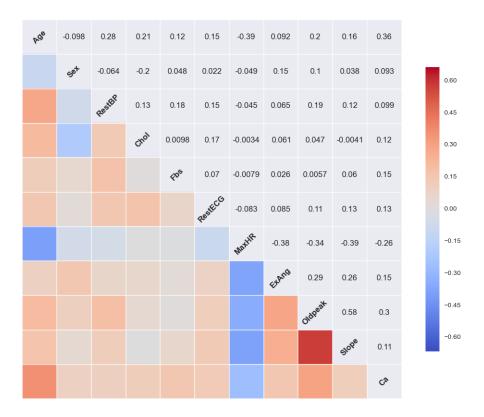

Fig. 8: Correlation Matrix plot in Python.

FIVE

PRE-PROCESSING PROCEDURES

Note: Well begun is half done – old Chinese proverb

In my opinion, preprocessing is crucial for the data mining algorithms. If you get a good pre-processing, you will definitely get a beeter result. In this section, we will learn how to do a proper pre-processing in $\bf R$ and $\bf Python$.

5.1 Rough Pre-processing

· dealing with missing data

Usually, we have two popular way to deal with the missing data: replacing by 0 or replacing by mean value.

- dealing with missing data in R
- dealing with missing data in Python

5.2 Source Code for This Section

The code for this section is available for download for R, for Python,

SUMMARY OF DATA MINING ALGORITHMS

Note: Know yourself and know your enemy, and you will never be defeated—idiom, from Sunzi's Art of War

Although the tutorials presented here is not plan to focuse on the theoretical frameworks of Data Mining, it is still worth to understand how they are works and know what's the assumption of those algorithm. This is an important steps to know ourselves.

6.1 Diagram of Data Mining Algorithms

An awesome Tour of Machine Learning Algorithms was published online by Jason Brownlee in 2013, it still is a good category diagram.

6.2 Categories of Data Mining Algorithms

- 0. Dimensionality Reduction Algorithms
- Principal Component Analysis (PCA)
- Nonnegative Matrix Factorization (NMF)
- Independent Component Analysis (ICA)
- Linear Discriminant Analysis (LDA)
- 1. Regression Algorithms
- Ordinary Least Squares Regression (OLSR)
- Linear Regression
- Logistic Regression
- 2. Regularization Algorithms
- Ridge Regression

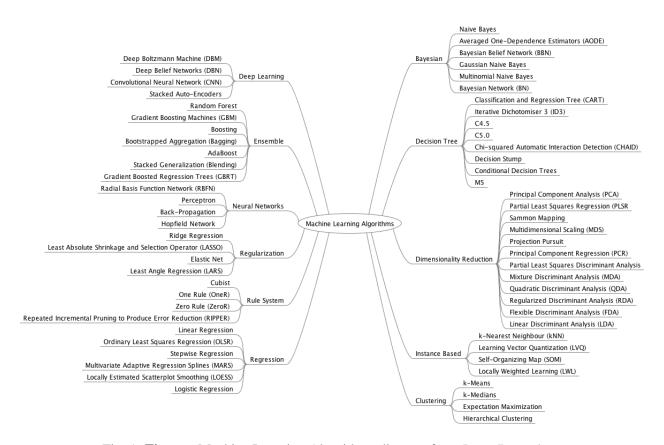

Fig. 1: Figure: Machine Learning Algorithms diagram from Jason Brownlee.

- Least Absolute Shrinkage and Selection Operator (LASSO)
- Elastic Net
- Least-Angle Regression (LARS)
- 3. Decision Tree Algorithms
- Classification and Regression Tree (CART)
- Conditional Decision Trees
- 5. Bayesian Algorithms
- Naive Bayes
- 6. Clustering Algorithms
- k-Means
- k-Medians
- Expectation Maximisation (EM)
- Hierarchical Clustering
- 8. Artificial Neural Network Algorithms
- Perceptron
- Back-Propagation
- Hopfield Network
- Radial Basis Function Network (RBFN)
- 9. Deep Learning Algorithms
- Deep Boltzmann Machine (DBM)
- Deep Belief Networks (DBN)
- 11. Ensemble Algorithms
 - Boosting
 - Bootstrapped Aggregation (Bagging)
 - AdaBoost
 - Gradient Boosting Machines (GBM)
 - Gradient Boosted Regression Trees (GBRT)
 - · Random Forest

lining With Python and R	1		

DIMENSION REDUCTION ALGORITHMS

7.1 What is dimension reduction?

In machine learning and statistics, dimensionality reduction or dimension reduction is the process of reducing the number of random variables under consideration, via obtaining a set "uncorrelated" principle variables. It can be divided into feature selection and feature extraction. https://en.wikipedia.org/wiki/Dimensionality_reduction

7.2 Singular Value Decomposition (SVD)

At here, I will recall the three types of the SVD method, since some authors confused the definitions of these SVD method. SVD method is important for the dimension reduction algorithms, such as Truncated Singular Value Decomposition (tSVD) can be used to do the dimension reduction directly, and the Full Rank Singular Value Decomposition (SVD) can be applied to do Principal Component Analysis (PCA), since PCA is a specific case of SVD.

1. Full Rank Singular Value Decomposition (SVD)

Suppose $\mathbf{X} \in \mathbb{R}^{n \times p}$, (p < n), then

$$\mathbf{X}_{n \times p} = \mathbf{U}_{n \times n} \mathbf{\Sigma}_{n \times p} \mathbf{V}^{T},$$

is called a full rank SVD of X and

- σ_i Sigular calues and $\Sigma = diag(\sigma_1, \sigma_2, \cdots, \sigma_p) \in \mathbb{R}^{n \times p}$
- u_i left singular vectors, $\mathbf{U} = [u_1, u_2, \cdots, u_n]$ and \mathbf{U} is unitary.
- v_i -right singular vectors, $\mathbf{V} = [v_1, v_2, \cdots, v_p]$ and \mathbf{V} is unitary.

2. Reduced Singular Value Decomposition (rSVD)

Suppose $\mathbf{X} \in \mathbb{R}^{n \times p}$, (n < p), then

$$\mathbf{X}_{n \times p} = \mathbf{\hat{U}}_{n \times p} \mathbf{\hat{\Sigma}}_{p \times p} \mathbf{\hat{V}}^{T},$$

is called a Reduced Singular Value Decomposition **rSVD** of **X** and

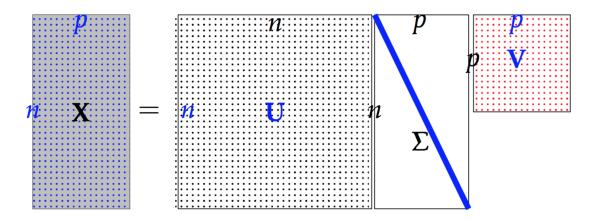

Fig. 1: Singular Value Decomposition

- σ_i Sigular calues and $\hat{\Sigma} = diag(\sigma_1, \sigma_2, \cdots, \sigma_p) \in \mathbb{R}^{p \times p}$
- u_i left singular vectors, $\hat{\mathbf{U}} = [u_1, u_2, \cdots, u_p]$ is column-orthonormal matrix.
- v_i right singular vectors, $\hat{\mathbf{V}} = [v_1, v_2, \cdots, v_p]$ is column-orthonormal matrix.

3. Truncated Singular Value Decomposition (tSVD)

Suppose $\mathbf{X} \in \mathbb{R}^{n \times p}$, (r < p), then

$$\mathbf{X}_{n \times p} = \mathbf{\hat{U}}_{n \times r} \mathbf{\hat{\Sigma}}_{r \times r} \mathbf{\hat{V}}^{T}, \tag{7.1}$$

is called a Truncated Singular Value Decomposition tSVD of X and

- σ_i Sigular calues and $\hat{\Sigma} = diag(\sigma_1, \sigma_2, \cdots, \sigma_r) \in \mathbb{R}^{r \times r}$
- u_i left singular vectors, $\hat{\mathbf{U}} = [u_1, u_2, \cdots, u_r]$ is column-orthonormal matrix.
- v_i right singular vectors, $\hat{\mathbf{V}} = [v_1, v_2, \cdots, v_p]$ is column-orthonormal matrix.

Figure *Truncated Singular Value Decomposition* indictes that the dimension of $\hat{\mathbf{U}}$ is smaller than \mathbf{X} . We can use this property to do the dimension reduction. But, usually, we will use SVD to compute the Principal Components. We will learn more details in next section.

7.3 Principal Component Analysis (PCA)

Usually, there are two ways to implement the PCA. Principal Component Analysis (PCA) is a specific case of SVD.

$$\mathbf{X}_{n \times p} = \hat{\mathbf{U}} \tag{7.2}$$

REGRESSION ALGORITHM

Note: A journey of a thousand miles begins with a single step – old Chinese proverb

In statistical modeling, regression analysis focuses on investigating the relationship between a dependent variable and one or more independent variables. Wikipedia Regression analysis

In data mining, Regression is a model to represent the relationship between the value of lable (or target, it is numerical variable) and on one or more features (or predictors they can be numerical and categorical variables).

8.1 Ordinary Least Squares Regression (OLSR)

8.1.1 Introduction

Given that a data set $\{x_{i1}, \dots, x_{in}, y_i\}_{i=1}^m$ which contains n features (variables) and m samples (data points), in simple linear regression model for modeling m data points with one independent variable: x_{i1} , the formula is given by:

$$y_i = \beta_0 + \beta_1 x_{ij}$$
, where, $i = 1, \dots, m, j = 1, \dots, n$.

In matrix notation, the data set is written as $\mathbf{X} = [x_1, \dots, x_n]$ with $x_j = \{x_{\cdot j}\}_{j=1}^n$, $\mathbf{y} = \{y_i\}_{i=1}^m$ (see Fig. Feature matrix and label) and $\boldsymbol{\beta}^{\top} = \{\beta_i\}_{i=1}^m$. Then the normal equations are written as

$$y = X\beta$$
.

8.1.2 How to solve it?

- 1. Direct Methods (For more information please refer to my Prelim Notes for Numerical Analysis)
 - For squared or rectangular matrices

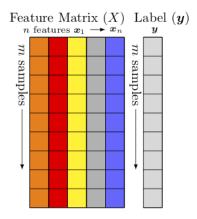

Fig. 1: Feature matrix and label

- Singular Value Decomposition
- Gram-Schmidt orthogonalization
- QR Decomposition
- For squared matrices
 - LU Decomposition
 - Cholesky Decomposition
 - Regular Splittings

2. Iterative Methods

- Stationary cases iterative method
 - Jacobi Method
 - Gauss-Seidel Method
 - Richardson Method
 - Successive Over Relaxation (SOR) Method
- Dynamic cases iterative method
 - Chebyshev iterative Method
 - Minimal residuals Method
 - Minimal correction iterative method
 - Steepest Descent Method
 - Conjugate Gradients Method

DEVELOPING YOUR OWN PYTHON PACKAGES

It's super easy to wrap your own package in Python. I packed some functions which I frequently used in my daily work. You can download and install it from My ststspy library. The hierarchical structure and the directory structure of this package are as follows.

13.1 Hierarchical Structure

```
README.md
____init__.py
___requirements.txt
___setup.py
___statspy
_____init__.py
___basics.py
____tests.py
___tests.py
___test
____nb
_____t.test.ipynb
____test1.py
3 directories, 9 files
```

From the above hierarchical structure, you will find that you have to have __init__.py in each directory. I will explain the __init__.py file with the example below:

13.2 Set Up

```
from setuptools import setup, find_packages

try:
    with open("README.md") as f:
        long_description = f.read()
except IOError:
    long_description = ""
```

```
try:
    with open("requirements.txt") as f:
        requirements = [x.strip() for x in f.read().splitlines() if x.strip()]
except IOError:
    requirements = []

setup(name='statspy',
    install_requires=requirements,
    version='1.0',
    description='Statistics python library',
    author='Wenqiang Feng',
    author_email='von198@gmail.com',
    url='git@github.com:runawayhorse001/statspy.git',
    packages=find_packages(),
    long_description=long_description
)
```

13.3 Requirements

```
pandas
numpy
scipy
patsy
matplotlib
```

13.4 ReadMe

```
pip uninstall statspy

- test

```{bash}

cd statspy/test
python test1.py

```
```
